KEEP UP TO DATE

Between the time you ordered this report—which is only one of the hundreds of thousands in the NTIS information collection available to you—and the time you are reading this message, several *new* reports relevant to your interests probably have entered the collection.

Subscribe to the **Weekly Government Abstracts** series that will bring you summaries of new reports *as soon as they are received by NTIS* from the originators of the research. The WGA's are an NTIS weekly newsletter service covering the most recent research findings in 25 areas of industrial, technological, and sociological interest—invaluable information for executives and professionals who must keep up to date.

The executive and professional information service provided by NTIS in the **Weekly Government Abstracts** newsletters will give you thorough and comprehensive coverage of government-conducted or sponsored research activities. And you'll get this important information within two weeks of the time it's released by originating agencies.

WGA newsletters are computer produced and electronically photocomposed to slash the time gap between the release of a report and its availability. You can learn about technical innovations immediately—and use them in the most meaningful and productive ways possible for your organization. Please request NTIS-PR-205/PCW for more information.

The weekly newsletter series will keep you current. But *learn what you have missed in the past* by ordering a computer **NTISearch** of all the research reports in your area of interest, dating as far back as 1964, if you wish. Please request NTIS-PR-186/PCN for more information.

Keep Up To Date With SRIM

SRIM (Selected Research in Microfiche) provides you with regular, automatic distribution of the complete texts of NTIS research reports *only* in the subject areas you select. SRIM covers almost all Government research reports by subject area and/or the originating Federal or local government agency. You may subscribe by any category or subcategory of our WGA **(Weekly Government Abstracts)** or **Government Reports Announcements and Index** categories, or to the reports issued by a particular agency such as the Department of Defense, Federal Energy Administration, or Environmental Protection Agency. Other options that will give you greater selectivity are available on request.

The cost of SRIM service is only 45¢ domestic (60¢ foreign) for each complete microfiched report. Your SRIM service begins as soon as your order is received and processed and you will receive biweekly shipments thereafter. If you wish, your service will be backdated to furnish you microfiche of reports issued earlier.

Because of contractual arrangements with several Special Technology Groups, not all NTIS reports are distributed in the SRIM program. You will receive a notice in your microfiche shipments identifying the exceptionally priced reports not available through SRIM.

A deposit account with NTIS is required before this service can be initiated. If you have specific questions concerning this service, please call (703) 451-1558, or write NTIS, attention SRIM Product Manager.

AN ORDERING OF THE NIOSH SUSPECTED CARCINOGENS LIST

In June, 1975, the National Institute for Occupational Safety and Health (NIOSH) published a document entitled Suspected Carcinogens, A Subfile of the NIOSH Toxic Substances List which presented data on approximately 1500 chemical substances. According to that report these chemicals have been reported in the literature to cause benign or malignant tumors in at least one species. The Office of Toxic Substances, is engaged in an effort to arrange these substances in a meaningful and useful way. The listing presented in this document is the first product of this effort. This ordered list is not being preferred as a ranking of these substances as carcinogenic hazards. Rather, it is an indication of the relative degree of concern that might be warranted for a particular substance regarding its possible carcinogenic potential. A thorough study of the factors relating to exposure to a specific substance as well as careful evaluation of all of its toxicity data are necessary for determining its potential hazard. Preparation of this ordered list did not include such an undertaking but simply utilized carcinogenic-related data as they were presented in the NIOSH Suspected Carcinogens Subfile.

This ordered list will be more meaningful to the user having some familiarity with both the NIOSH Suspected Carcinogens Subfile and the NIOSH Registry of Toxic Effects of Chemical Substances (formerly the Toxic Substances List) from which it was derived. The user should be particularly mindful of the limitations on interpreting data in those lists, which are also necessarily inherent in this ordered version. In particular it must be recognized that a notation of a carcinogenic or neoplastic response is based on the conclusions in the cited study and no attempt to resolve questionable published data nor to evaluate the author's interpretation either by NIOSH or the Office of Toxic Substances has been made. It is not appropriate to conclude that all of the substances on this list are carcinogenic.

The data presented in the NIOSH Registry and the Suspected Carcinogens Subfile for each substance are the NIOSH identification number,

a preferred chemical name, synonyms, the Chemical Abstracts Service Registry Number, the Wisswesser Line Notation, the molecular weight and formula, and toxic dose lines, which indicate the species tested, the route of administration of the compound, the dose administered and the observed toxic effect, and the reference to the report from which the data were obtained.

Ordering Approach

In ordering this list, a four-digit number (ABCD) has been computed for each compound, utilizing data presented in the toxic dose lines for that compound. Only those toxic dose lines which had a carcinogenic (CAR) or neoplastic (NEO) response noted were used. For the purposes of this effort, CAR and NEO responses were considered equivalent.

The four-digit numbers were computed using the following criteria:

The first digit, A, represents the species in which a CAR or NEO response was reported, and assignments were made thus:

7: humans
6: monkeys
5: cat, dog, pig, cattle, or domestic animal
4: rat
3: mouse
2: guinea pig, gerbil, hamster, rabbit, squirrel, unspecified mammal
1: wild bird, bird, chicken, duck, pigeon, quail or turkey
0: frog

For compounds where CAR or NEO responses were reported in more than one species, the highest number was assigned.

The second digit, B, designates the number of different species for which a CAR or NEO response was reported, up to a maximum number of 9.

The third digit, C, was assigned on the basis of the route of administration for which a CAR or NEO response was reported:

2: inhalation, ocular or skin application

1: oral administration

0: all other routes of administration.

Only the highest number was retained where CAR or NEO responses were reported for more than one route of adminstration.

The final digit, D, is the total number of CAR and/or NEO responses reported for this substance, up to a maximum of 9. Because the NIOSH Registry included only one entry for any route/species combination (specifically the study in which the lowest effective dose was reported for that combination), this digit is a count of the number of different species/route combinations reported to result in a carcinogenic or neoplastic response.

The following example illustrates the assignment of this number.

The order number for this compound is 5529. The first digit (5) is assigned because a NEO repsponse is reported in the dog; the second digit (5) because a CAR or NEO response is reported for 5 different species (rat, mouse, dog, rabbit, and hamster); the third digit (2) was assigned because a CAR response was elicited with a skin application of the substance; and finally the last digit (9) was assigned because CAR or NEO repsponses were reported in 10 differnt route/species combinations and because the maximum allowable is 9, it defaults to this.

Rationale

The rationale used to develop the individual digit assignment criteria for this ordering exercise was the following:

(A) The rationale for this ordering scheme is the following. For the first digit, it was felt that a CAR or NEO response reported in humans or primates indicated evidence or suspicion that the compound is a human carcinogen. Cats, dogs, etc. were ranked beneath these on a phylogenic basis. While the rat and mouse are not phylogenically higher than the other small mammals ranked beneath them, it was felt that because these two species have been extensively studied and physiological responses of these animals to chemical insult are far better understood, a CAR or NEO response reported for these two species is probably more meaningful than such reported response in the less well studied species ranked beneath them. Between these two species, the rate was given precedence because it in turn is a better studied species than the mouse and also because it is longer lived than the mouse.

(B) The rationale for the second digit is that a compound shown to be carcinogenic or neoplastic in several species is more likely to be universally carcinogenic than a compound where the effect has only been shown in one or two species.

(C) The third digit indicates the potential for carcinogenic or neoplastic response resulting from environmental exposure. In this respect, inhalation or skin application resulting in such a response are more indicative of concern for environmental exposure to the substance than would be indicated by carcinogenic or neoplastic responses occuring from injection of the substance. Oral adminstration was considered intermediate to these.

(D) The final digit indicates that the CAR or NEO response has been confirmed both in different species (as in the second digit) and by different routes of adminstration within a given species.

The arrangement of the four digits into the ABCD sequence is based on the relative significance of each digit. The first digit is considered most significant because it indicates the human carcinogenic potential of the compound. The second digit focuses on the universality of the response among different species and indicates the likelihood that the compound has human carcinogenic potential, but to a lesser degree than the first digit. The next most significant parameter is considered to be the type of exposure required to elicit the response and is reflected by the third digit. The final digit is included as an indication of the degree of confidence about the carcinogenic or neoplastic response associated with the compound. Because of certain limitations involved in its genesis (for example many known carcinogens are repeatedly studied for the purpose of obtaining tumors for further study), this fourth digit was given the least importance in ordering the compounds.

Format of the List

There are two parts to this ordered list. In Part I, the compounds are presented by the four-digit number in descending order. Each entry includes the NIOSH identification number, the Chemical Abstracts Service registry number, the preferred chemical name and the list of synonyms. In Part II, the compounds are arranged alphabetically by chemical names and show the order number for each substance at the preferred chemical name entry.

These listings were computer generated, utilizing an updated tape version of the NIOSH Suspected Carcinogens Subfile. This updated version contains additional data not presented in the list published in June, 1975. Some of the data presented in the published version has since been removed from the subfile following closer examination of the data by NIOSH. A brief description of the software used to produce these listings is presented in the Appendix.

Computer Routine Used to Produce the Ordered NIOSH Suspected Carcinogens List

The ordered NIOSH Suspected Carcinogens List was computer generated, utilizing an updated tape version of the NIOSH Registry of Toxic Effects of Chemicals. The programs used for generating the ordered Suspected Carcinogens List are described below and are shown schematically in the accompanying diagram. All programs used were in COBOL computer language.

1. CAR/NEO Extract Program

Using the latest NIOSH Registry of Toxic Effects of Chemicals master tape, this program extracted the complete file of records for each compound that has a CAR or NEO data line. The output is designated EPACAR and is similar to the published NIOSH Carcinogens Subfile, but does not contain cross-reference records for synonyms.

2. CAR/NEO T-Line Extract Program

This program uses the EPACAR tape and eliminates from it all T-Lines (i.e., toxic dose data lines) that do not have a CAR or NEO response indicated. The output is designated EPATAR, and these records are hereafter referred to as the EPATAR records.

3. Ordering Program

Using the EPATAR tape, this program analyzes the toxic dose data lines of each record using the rules as described in the preface. A special record is created which contains the NIOSH identification number and the ordering number assigned to each compound. These special records and all records on the EPATAR tape are written on the output tape, designated EPARAN.

4. EPARAN Sorting Program

This program sorts the EPARAN by NIOSH identification number so that the special records are placed in front of the compound records as created on the EPATAR tape. This output is designated EPAMAS.

5. Add Ordering Numbers to EPATAR Records

This program adds the ordering number in the special records to the EPATAR records for each compound. The special records are removed and the output is designated EPAEXT.

6. EPAEXT Sort by Ordering Number Program

This program sorts the records on the EPAEXT tape, arranging them in descending order by value of the ordering number. Compounds with the same ordering number are arranged alphabetically. The output tape is designated EPAPRT.

7. EPAPRT Print Program

This program prints the EPAPRT tape. Only the ordering number, NIOSH identification number, Chemical Abstracts Service Registry Number, and synonyms are printed. This printout is the first listing presented in this document.

To create the second listing presented in this document, the following routine was used.

1. Cross Reference Records Extraction

In addition to the records containing all the information described previously, the NIOSH lists also contain cross-reference records in which a synonym for a compound is given with reference back to the preferred chemical name where the complete data record is displayed. This program extracts all of these records from the master tape. The output tape, which is designated BMAS, includes both the cross-references to compounds which have CAR or NEO records and to those compounds which do not.

2. BMAS Sort Program

The records on the BMAS tape are sorted by virtue of the NIOSH identification number to which they refer. It is necessary to place

these records in sequence for proper matching against the main records to eliminate those cross-reference records which refer to compounds not containing CAR or NEO data. The output tape is designated BPUL.

3. Matching Program

This program matches the records on the BPUL tape with the records on the EPAEXT tape. A new tape is created which contains all the records on the EPAEXT tape and the cross reference records which refer to a record on the EPAEXT tape. The output is designated CARTEM.

4. CARTEM Sorting Program

This program sorts the CARTEM tape using the NIOSH identification number to place the records (both the complete data records and cross-reference records) in the proper alphabetical sequence. The output tape is designated CARMAS.

5. CARMAS Print Program

This program prints the CARMAS tape. Only the ordering number, NIOSH identification number and preferred chemical name are printed from the complete record entries; NIOSH identification number, synonym name and "See ID No., preferred chemical name" for the cross-reference records. For the cross-reference records, a "0" is placed where the ordering number occurs for main entries. The printout is the second listing presented in this document.
